

# TENBUSCH Testing Mandrel

Testing mandrels, sometimes called “prover” mandrels, can be extremely valuable tools, especially when sliplining old brick and poured in place structures.

Testing mandrels are custom built to the same size and shape as the pipe used in the sliplining process. The passage of the mandrel through the existing structure will ensure that the new pipe can be inserted without stoppage or delay.

These mandrels can be configured as skeletons assemblies to not only allow the passage of the sewer stream while the mandrel is pulled in either direction, but in dry pipe conditions the skeleton will allow for man entry to remove obstructions.
